The increasing complexity of embedded systems also results in a rapid growth of the software part, which tends to be developed in object oriented programming languages like C++ or Java. Originally planned for embedded systems, Java recently plays again a more important role in the context of embedded system from different points of views. Especially platform independence, multithreading parallelism, and internet embedding are important advantages and contribute to the increasing importance of Ja ...

Embedded systems bring special purpose computing power to consumer electronics devices such as smartcards, CD players and pagers. Java is being aggressively targeted at such systems with initiatives such as the Java 2 Platform, Micro Edition, which introduces certain efficiency optimizations to the Java Virtual Machine. Code size reduction has been identified as an important future goal for ensuring Java's success on embedded systems [20]. However, limited processing power and timing constraints ...
